

Nordgrim Colony

Rotunda 2 assembly instructions

Nordgrim Colony is a terrain set designed by Tarjei Mossige Aasen. Find me at <https://www.thingiverse.com/Bilbostomper>

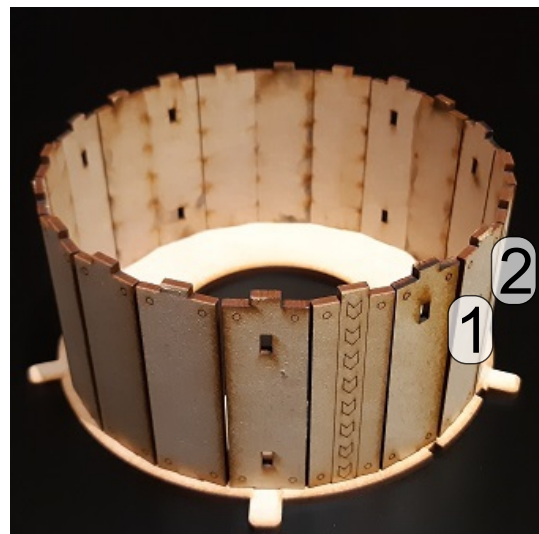

When assembling this structure, start with the bottom plate, and attach the 20 side panels. There are three types of sides - 12 without slots, 3 with one and 5 with two.

We'll start with the side panel behind where the ladder attaches and call that side panel 1 (see picture) and then number the panels in counter-clockwise order. Side panels should then be placed thusly:

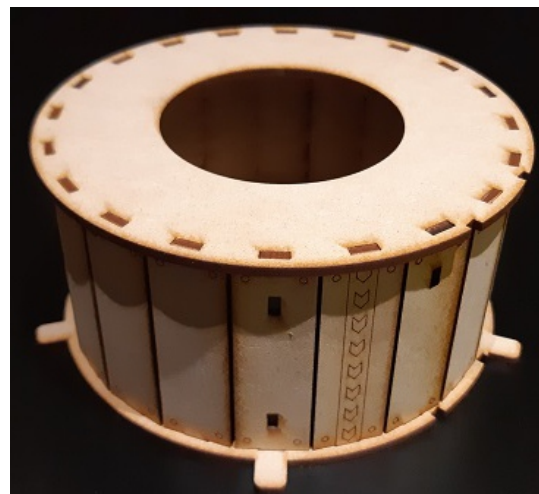

No slots: panels 1, 3, 5, 7, 8, 9, 11, 13, 15, 16, 17, 19

One slot: panels 4, 12, 20

Two slots: 2, 6, 10, 14, 18

Attach the lower top plate with the round opening. This can be quite fiddly. Make sure the notches for the ladder line up.

Place the upper top plate. Make sure the gap for the ladder is in the right place. Panel 1 is labeled in the picture.

You get three sprues of little T-shaped pieces (you only need 10). Clip them apart and trim away the remains of the sprue. If you want to have Rotunda 3 be able to screw onto the top of this piece, make sure the T-shapes aren't pressed all the way down or the fitting will be very tight.

Attach the long support pieces to the side panels with two slots and attach the U-shaped connection point pieces.

Attach the short support pieces in the remaining notches, and add the ladder.

Finally, attach the six railing pieces.

Finished!
